VOSENEVA (Miro, M. N.). Ammoniacal content of potatoes and its exchange in plants infected by viruses. [English summary.] *Bull. Acad. Sci. U.R.S.S., 1939, Ser. Biol., 6, pp. 1103-1115, 1939.*

Under southern Russian conditions degeneration of potatoes is stated to be correlated with early planting and probably due to high temperatures, and it was found by experiments in Moscow during 1936-7 that potatoes planted in summer differed little from the normal in appearance and chemical metabolism, while those planted in the spring showed an increase in ammoniacal and amide nitrogen both in the tubers and green parts. This increase was also witnessed in plants grown from degenerated tubers under glass at temperatures lower than those prevailing in southern Russia. Similar increases were detected in potato tubers subjected to artificial heating and also in the plants developing from such tubers. Potatoes attacked by rugose or aucuba mosaics also showed an increase in ammonia nitrogen but little increase, or even a decrease, in amide nitrogen [cf. R.A.M., xvi, p. 707; xix, p. 39]; as compared with a value of 100 for tubers and green parts of healthy Epicure potatoes, the amounts of ammonia nitrogen in early rugose and those affected with rugose mosaic were 242.2 and 230.3 respectively. Similarly, with Holland potatoes the ammonia nitrogen values in aucuba-diseased tubers and green parts were 111.5 and 118.3, respectively, and those of amide nitrogen 55.2 and 36.7, respectively, the values for healthy plants being 100. The nitrogen metabolism of tobacco plants artificially infected with the tobacco mosaic virus varied: the susceptible *Nicotiana glauca* var. *maculosa* showed a gradually rising increase in the amount of protein, while the resistant *N. glauca* and *N. rustica* showed a decrease. The contents of ammoniacal and amide nitrogen in infected tobacco plants exhibited great irregularity, following apparently no rules.

VOROBIEVA (Mme M. N.). Proteolytic activity of a preparation from Tobacco mosaic virus.—*C.R. Acad. Sci. U.R.S.S., N.S.*, xxx, 5, pp. 466-467, 1941.

The results are given of an investigation on the effect of tobacco mosaic virus protein on seven-day-old tomato seedlings thoroughly ground up in a mortar and the destruction of the normal proteolytic enzymes then effected by boiling. By the addition to such preparations of tobacco mosaic protein (obtained by the method of Ryjkoff and Gromyko [*R.A.M.*, xvii, p. 708]) together with toluol as an antiseptic and following incubation at 32° C. for 106 hours, hydrolysis of protein took place, the degree of hydrolysis being greater when 0.51 per cent. potassium cyanide was present. It is suggested that this hydrolysis was effected by the virus protein itself or that there had been adsorption of proteolytic enzymes on the surface of the virus protein used.

Tars.

Orig Pub : Chem. promysl, 1958, 8, No 1, 50-51

Abstract : According to a method worked out, xylenol and cresol fractions of tar that are intended for the production of artificial tars are brominated with a 0.1 normal solution of KBrO_3 , KBr in an acid methanol medium, with indications of the point of equivalence by means of a rotating Pt-electrode. It is noted that the method gives reproducible results for the determinations both of pure phenols and of technical products;

TITLE: Change in the electric and photoelectric properties of silicon by heat treatment 16 21

SOURCE: Ukrayins'kyi fizychnyy zhurnal, v. 11, no. 7, 1966, 745-751

TOPIC TAGS: silicon semiconductors, Hall effect, photoconductivity, relaxation process, semiconductor carrier, electron recombination, photon emission, impurity center

ABSTRACT: The authors heated single-crystal silicon in evacuated quartz ampoules and measured the Hall effect, the stationary intrinsic photoconductivity, and the photo-magnetic emf. The impurity photoconductivity studied with a spectrometer and recorded with a synchronous detector. The photoconductivity relaxation kinetics was investigated by applying light pulses. The concentration of the equilibrium carriers (electrons and holes) were determined from the Hall effect. The production of adhesion and capture centers was effected by heating to various high temperatures. The results show that heat treatment of n-Si at 1050C and of p-Si at $T > 750C$ leads to

Card 1/2

L 09351-67

ACC NR: AP6031315

formation of centers which greatly influence the concentration of the equilibrium carriers and the intrinsic and impurity photoconductivities. Recombination of the carriers through some of the centers can occur, accompanied by photon emission. These centers are connected with diffusion of the impurities from the surface and the formation of impurity complexes, or else with structure defects. Annealing at temperatures close to 500C deactivates the thermally induced adhesion and capture centers. Orig. art. has: 7 figures.

TITLE: A phase demodulator of the second harmonic, with width modulation

SOURCE: Slaboproudy obzor, v. 25, no. 1, 1964, 21-24

TOPIC TAGS: phase demodulator, modulation, width modulation, second harmonic,
phase detector

ABSTRACT: A new phase demodulator of the second harmonic, with width modulation,
is described, and its response (transfer coefficient, zero point stability,
dynamic characteristics) is analyzed theoretically and confirmed experimentally.
Designed with semiconductor triodes, the phase demodulator needs only a small
signal power with sufficient zero stability and yields a high power gain. It
was used in a measuring amplifier for constant current of high stability.

ABSTRACT: The operating principles and properties of a second-har-
monic detector using transistors operating in the switching mode are
analyzed. The operation is based on double conversion of the mea-
sured signal. The second-harmonic signal is first mixed with a fun-
damental-frequency reference voltage. The resultant difference in

Card

1/2

ACCESSION NR: AT4008773

in the durations of the positive and negative half cycles of the combined signal is a function of both the ratio of the amplitudes of the first and second harmonics and of the phase shift between them. This makes it possible to use as the second conversion stage a circuit similar to an ordinary phase detector with switching transistors and to obtain both proportionality of the conversion and power amplification of the measured signal. The performance of the circuit is analyzed for different harmonic ratios as a function of the circuit parameters. The detector was used as a demodulator in a stabilized dc amplifier developed at the Institut mashinovedeniya i avtomatiki AN UkrSSR (Institute of the Science of Machines and Automation, AN UkrSSR). TITLE: D-c measuring amplifier

SOURCE: Pribury i tekhnika eksperimenta, no. 3, 1963, 89-92

TOPIC TAGS: d-c measuring amplifier, strong negative feedback, d-c to a-c converter, magnetic modulation, frequency doubling, voltage amplifier

ABSTRACT: The development of a d-c amplifier capable of measuring extremely small d-c signals is reported. The amplifier uses a strong negative feedback loop with a d-c to a-c converter, a magnetic modulator, a frequency doubler, and a d-c to a-c converter. The modulator has a frequency of 100 Hz, while the doubler has a frequency of 200 Hz. The amplifier has a gain of 1000 and a bandwidth of 10 Hz. The excitation frequency of the modulator is 100 Hz. A signal of 10 mV is applied to the modulator input, which is amplified and then applied to the amplifier input.

L 70015-63

ACCESSION NR: AP3002726

The two-stage tuned amplifier suppresses first and third harmonics by a factor of 150 and 80, respectively. The voltage amplification factor is approximately 5000. The bright-type transistors of the phase detector are controlled by a voltage of 100V. The phase detector is a two-stage device. The first stage is a phase detector with a gain of 100. The second stage is a phase detector with a gain of 100. The phase detector is a two-stage device. The first stage is a phase detector with a gain of 100. The second stage is a phase detector with a gain of 100.

The phase detector allows the use of a 10-amp amplifier as the last stage of the device. The device has the following characteristics: measurement range of 10-1000 Hz, accuracy of 1%, power consumption of 10W, and operating temperature range of -40 to +40°C.

TITLE: Frequency stabilization in the relaxation oscillator by a tuned LC-circuit

SOURCE: Radiotekhnika, v. 19, no. 6, 1964, 45-49

TOPIC TAGS: oscillator, relaxation oscillator, frequency stabilization, relaxation oscillator stabilization

ABSTRACT: A theoretical analysis of a relaxation oscillator whose frequency is stabilized by a tuned LC-circuit cut in series with the oscillator control winding (see Enclosure 1) is presented. The effects of supply voltage, load, Q-factor of the oscillatory circuit, and transistor current gain upon the relaxation-oscillator frequency are analyzed. An experimental verification included a relaxation oscillator designed with P25 transistors and D7A diodes and operated at 1,000 cps and an output power of 1 w. Frequency deviation vs. Q-factor (up to 16) and load

TITLE: A measuring ¹⁰transducer with input-output isolation

SOURCE: Avtomatyka, no. 3, 1966, 72-77

TOPIC TAGS: negative feedback, automatic control theory, semiconductor rectifier, switching circuit, magnetic modulation

ABSTRACT: The authors describe the working principle of a device for isolating the input terminals of a measuring transducer from its output terminals. Since the operating element is not involved in negative feedback, it ensures high precision of conversion. A d-c transformer of this type can be made by converting the output voltage of a measuring transducer into a-c voltage with subsequent transformation and rectification using transistors in a switching circuit. The transistors at the input are controlled by an external source and act as a modulator which changes d-c voltage into square-wave a-c. This alternating current is rectified by transistors which open the demodulator circuit and are controlled by the same voltage source. The possible sources of error are analyzed and the conclusion is drawn that the isolation device can achieve conversion linearity of at least 0.1% at 20°C where additional error is

Card 1/2

L 02414-67

ACC NR: AP6018022

not more than 0.1% at 20-70°C. Experimental data are given for operation of the measuring transducer with isolation. This transducer has a magnetic modulator with double-frequency input, converting a d-c input signal into a-c voltage. This type of modulator maintains high stability at the zero level which makes it possible to develop a measuring transducer with an error of less than 0.3%, using the isolating device at 20-60°C. The device may be used in switching from a circuit without isolation to one with isolation without difficult adjustment. Orig. art. has: 2 figures.

Vorobkov, Lev Nikolayevich, Vladimir Matveyevich Gavrilko, Petr Vladimirovich Lobachev, and Vsevolod Mikaylovich Shestakov

Vodoponizheniye v gidrotekhnicheskom stroitel'stve (Lowering the Water Table in Hydrotechnical Construction) Moscow, Gosstroyizdat, 1960. 243 p. Errata slip inserted. 4,000 copies printed.

Scientific Ed.: Yu. G. Trofimenkov, Candidate of Technical Sciences; Ed. of Publishing House: P. V. Safonov; Tech. Ed.: Ye. L. Temkina.

PURPOSE: This book is intended for engineering and technical personnel in hydrotechnical construction who are occupied with problems of lowering water tables. The book may also be of interest to mining personnel.

COVERAGE: The authors discuss the designing and calculation of systems for lowering water tables. They deal chiefly with

Lowering the Water Table (Cont.)

SOV/4912

large systems used in excavations for water works. Problems in installing the lowering apparatus are discussed. Special attention is given to the method using deep wells. Considerable space is given to the question of designing drainage systems for open-cut mine workings. L. N. Vorobkov wrote Sec. 1 of Ch. I, Sec. 1 of Ch. II, Sec. 1 of Ch. IV, and Secs. 1 and 2 of Ch. VII. V. M. Gavrilko wrote Ch. V and Secs. 1, 2, 3, 5, and 6 of Ch. VI. P. V. Lobachev wrote Secs. 3 and 4 of Ch. II; Secs. 2 and 3 of Ch. IV, and Sec. 4 of Ch. VII. Secs. 2 and 3 of Ch. I, Ch. III, and Sec. 4 of Ch. VI were written by V. M. Shestakov. Sec. 3 of Ch. VII was based on materials supplied by Engineer A. O. Shestopal. The authors thank Candidates of Technical Sciences V. M. Grigor'yev and Yu. G. Trofimenkov for their assistance. There are 100 references: 87 Soviet, 5 German, 6 English, and 2 French.

TITLE:

Determination of Tolerance in the Production of
Frame Antennas

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy - Priborostrye-
niye, 1958, Nr 5, pp 64-68 (USSR)

ABSTRACT:

The problem of the production tolerance is particularly important in connection with antennas which are built with a pointed shape and have only a small radiation to the sides. The amplitude of the single radiators does not only depend on the accuracy with which they were made, but also on the quality of the single parts of the antenna. The article then deals with the problem, of how the theoretical results of earlier studies on this subject can be most efficiently put into practice. The article deals in detail with the principle of electrical circuits, the selection of measuring techniques and technological principles, rational design, problems of design, and finally with examples of calculation. The antenna discussed

TITLE: Architectural and construction improvements and cargo characteristics of the SEV-2 universal dry-cargo ships with a dead weight of 12500 tons to be built between 1966 and 1970

SOURCE: Ref. zh. Vodnyy transport, Abs. 8A64

REF SOURCE: Tr. Tsentr. n. -i. in-ta morsk. flota, vyp. 67, 1965, 120-128

TOPIC TAGS: cargo ship, shipbuilding engineering, marine engine, cargo handling/595 A II ship

ABSTRACT: The results are presented of investigations of ships with a dead weight of about 12,500 tons carried out at the Central Scientific Research Institute of the Maritime Fleet (TsNIIMF). An estimate is given for the adaptability of different classes of ships to high-speed cargo handling. The 595 A II with twin hatches is found to be the most efficient ship. The main dimensions and characteristics of this ship are as follows: The maximum length—152.8 m, the length between uprights—140.0 m, width—20.6 m, side height to top deck—12.3 m,
